Computer Networks

Shortest Path Routing (§5.2.1-5.2.2)

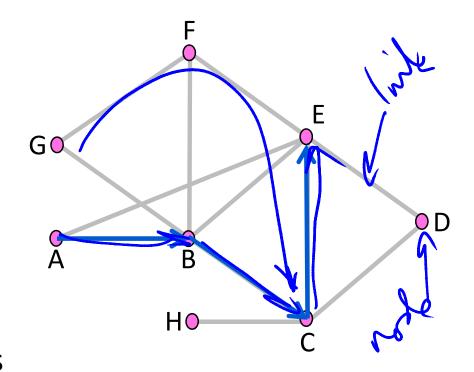

Topic

- Defining "best" paths with link costs
 - These are <u>shortest path</u> routes

What are "Best" paths anyhow?

- Many possibilities:
 - Latency, avoid circuitous paths
 - Bandwidth, avoid slow links
 - Money, avoid expensive links
 - Hops, to reduce switching
- But only consider topology
 - Ignore workload, e.g., hotspots

Computer Networks

-3

Shortest Paths

We'll approximate "best" by a cost function that captures the factors

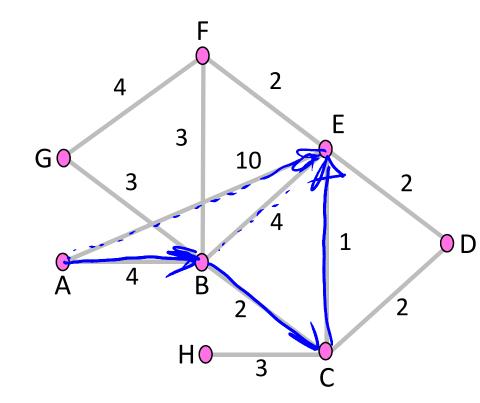

Often call lowest "shortest"

1. Assign each link a cost (distance)

- 2. Define best path between each pair of nodes as the path that has the lowest total cost (or is shortest)
- Pick randomly to any break ties

Shortest Paths (2)

- Find the shortest path A → E
- All links are bidirectional, with equal costs in each direction
 - Can extend model to unequal costs if needed

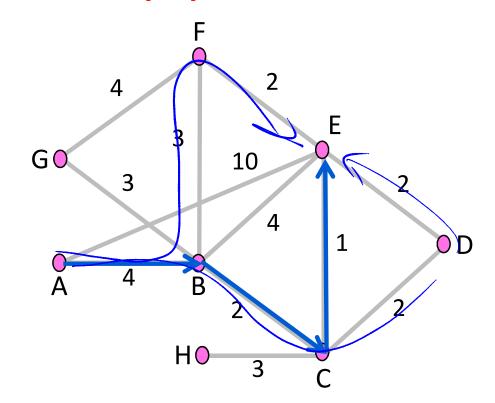

Computer Networks

5

Shortest Paths (3)

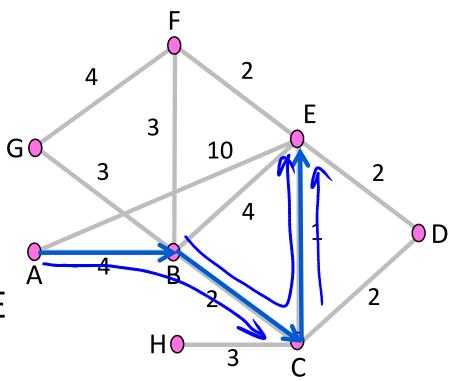

- ABCE is a shortest path
- dist(ABCE) = 4 + 2 + 1 = 7
- This is less than:
 - dist(ABE) = 8 <--</pre>
 - − dist(ABFE) = 9
 - dist(AE) = 10
 - dist(ABCDE) = 10

Computer Networks

Shortest Paths (4)

- Optimality property:
 - Subpaths of shortest paths are also shortest paths
- ABCE is a shortest path
 - →So are ABC, AB, BCE, BC, CE

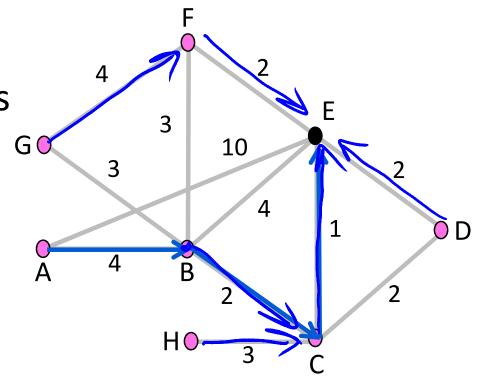

Computer Networks

7

Sink Trees

- Sink tree for a destination is the union of all shortest paths towards the destination
 - Similarly source tree
- Find the sink tree for E

Computer Networks

8

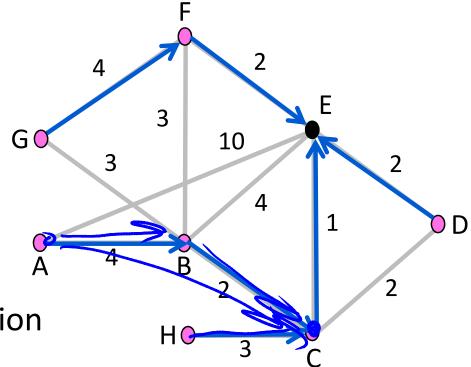

Sink Trees (2)

Implications:

- Only need to use destination to follow shortest paths
- Each node only need to send to the next hop

- Lists next hop for each destination
- Routing table may know more
